

PSAppDeployToolkit is a PowerShell-based framework that simplifies the deployment process for enterprises.

PowerShell App Deployment Toolkit usage are as follows:

1. **Deploying Applications:** Encapsulating standard MSI or setup executables, providing enhanced capabilities like prerequisite validation and silent installation.
2. **Scripting Deployment Logic:** Allows you to write script that control deployment process.
3. **Using Functions:** To perform common deployment tasks such as validating pre-requisite, closing in use-application
4. **Running Scripts:** Deploy scripts using PowerShell directly through deployapplication.exe
5. **Utilizing ADTSession:** Store and retrieve deployment related information enabling deployment logic and error handling.

Platform Value:

- **Simplifies Scripting:** Automates and streamlines deployment scripting for IT professionals.
- **Consistent UX:** Provides a standard user interface for a uniform deployment experience.
- **Reliable Deployments:** Reduces errors and improves deployment success rates.
- **Open-Source:** Freely available and community-driven for continuous improvement.

Key Concepts:

- **ADTSession Object:** Manages deployment data like user input and status for better control.
- **Pre-defined Functions:** Built-in functions for tasks like prerequisite checks and silent installs.
- **Exit Codes:** Standard codes to indicate deployment outcomes for easier troubleshooting.
- **Deployment Structure:** Organized folder system for maintainability.
- **Deployment Modes:** Supports interactive, silent, and non-interactive modes for flexibility.

Configuration Process:

1. **Download and Extract:** Download the PSAppDeployToolkit and extract the zip file.
2. **Locate Configuration File:** Navigate to the Toolkit\AppDeployToolkit directory and find the AppDeployToolkitConfig.xml file.
3. **Edit Configuration:** Open the AppDeployToolkitConfig.xml file and customize it according to your needs.

Toolkit Options: Configure general toolkit settings like required administrative rights, temporary file paths, and logging options.

Banner, Logo and Icon Options: Customize the UI banner, logos, and icons.

MSI Options: Configure logging options, log paths, and installation parameters for MSI installations

UI Options: Set general UI options like balloon notifications, script timeouts, and exit codes.

UI Messages: Edit or add languages for the user interface

4. Save and Apply: Save the changes to the AppDeployToolkitConfig.xml file. These changes will be applied to all scripts created using PSAppDeployToolkit.

The PowerShell Application Deployment Toolkit (PSAppDeployToolkit) provides template scripts for application deployment.

These scripts, like Deploy-Application.ps1, are designed to streamline the deployment process and ensure consistency across deployments.

Key Script

- Deploy-Applications.ps1- Main script used for both install and uninstall processes.
 - Editable in PowerShell ISE.
 - Uses Sections: Pre-Install, Install and Post-Install
 - Calls **AppDeployToolkitMain.ps1** for core logic

Creating New Deployments:

- Use templates to create new deployments:
 - For version 3:
New-ADTTemplate -Destination C:\Temp\MyAppDeployment -Name "MyOldAppDeployment" -Version 3
 - For version 4:
New-ADTTemplate -Destination C:\Temp\MyAppDeployment -Name "MyAppDeployment"

Resources:

- Templates are available on GitHub (v3 and v4 zip files).
- Download, extract, and customize as needed.

Customization:

- Modify **Deploy-Application.ps1** to fit your needs:
 - Change parameters
 - Add commands
 - Customize the user interface

To create deployment template you can use the following command:

```
New-ADTTemplate -Destination C:\\Temp\\MyAppdeployment -Name "MyAppDeployment"
```
